				· ,

High winds blew apart a car port causing damage to a small camper. The electrical box was also ripped from the house and numerous tree limbs were knocked down. The Montgomery County Chronicle contributed to this report.

A powerful late Spring upper-level system moved into the Central Plains during the early afternoon of June 5th. It appeared that a major tornado outbreak would occur from Nebraska into Oklahoma. Instead storms quickly evolved into bowing line segments producing mainly high winds. Isolated very intense winds occurred along mesovortices across portions of South Central Kansas.

Tree limbs were knocked down.			

Supercell thunderstorms erupted along a strong cold front across Central Kansas. The supercell storms produced destructive hail and damaging winds, along with tornadoes across Central, Kansas. A few strong tornadoes touched down just south of Salina, Kansas. The supercells would continue to track to the northeast and eventually produce the tornadoes that would hit Chapman, Kansas and Manhattan, Kansas.

A few rounds of strong to severe thunderstorms moved across primarily south-central and southeast Kansas from the evening hours of the 27th through the early to mid-morning hours of the 28th. The storms developed along a potent cold front surging south across the central plains, ahead of a strong upper level across the northern plains and upper midwest. Large hail, damaging winds and localized flooding were the primary hazards.
